PROLOGUE

Welcome reader to this book — a book whose cover alone signifies that we are trying to venture into uniqueness.

This book is the story of the class of 1969 — how we developed into the physicians we are today.

We want this book to be looked at and read. After you've seen all the pictures sit down and read our story — we hope you'll find it worthwhile.

THE FRESHMAN YEAR

A class history is a personal ledger. Though it strives to reflect a synthesis of peaks and valleys of our journey from acceptance to graduation, such a journey is of an intimate, sacred nature. Each of us will cherish certain remembrances and unsuccessfully try to blot out rather not-so-hallowed recollections. It is hoped that this sketch will serve as a framework upon which each of us can hang his own private memories of the days and years of these four years, retrievable only by himself, dreamed as a time which was common to all, but experienced only by the individual.

What was so special about that letter? It is in a small envelope, — strike one, guess. No! It! It actually says . . . quick, read it again . . . and again! Suddenly the world doesn't seem so perverse after all. So you tell friends and neighbors that you were accepted — and their reply . . . Bowman Forest? Oh yes, that little private school in . . . er . . . uh . . . North Carolina, isn't it? Well, it didn't have to be put that way, did it?

In any event, the first tangible evidence that you were on your way to the Medical Doctor was in hand, and the first milestone had been passed.

As with any pursuit in which involvement is delayed from the time of commitment, many of us experienced a catharsis during the intervening months between acceptance and matriculation. This was a period when the pressure of acceptance was in so far as undergraduate study was concerned, new courses might have slipped a little, but the pressure was an appreciative variant of attention. It was now. For one short term, the pressure was enjoyable. And thus four years of preparation came to a close.

It was in the entrance lobby of the medical school that we all assembled for the first time. Amazing that Miss Hutchinson knew everyone by recognition, wasn't it? We received our name tag (this one gratis, but the next . . . See Mrs. Parsons in the book store . . .) which served a dual purpose of identifying oneself to others and reminding oneself of his own identity, which occasionally was lost in fleeting moments of aphasia. There was the standard all-American range of surnames, most without difficulty; but somehow Dewar kept coming out Du-war rather than Doer as preferred by the owner. We met the Dean who in turn introduced us to the "master building plan", said his door was always open (but that he might not be in), and graciously disappeared in a

puff; thereupon materialized his first sergeant, foreman, or what have you, Dr. Tuttle. After only a few words, we could tell that he was the personification of the "powers that be". It likewise we could feel that this guy's on our side. And from him we first heard the oft-repeated admonition, now held as truth, "look at the upperclassmen. If those goons can do it, so can you!"

We followed treks over the school and hospital, led by the efficient upperclassmen, showing us places of interest — cafeteria, snack shop, book shop, library, the lab, student health, boy's john, girl's john — and on until we arrived back at the starting point, now more disoriented than before. We received book lists and were instructed to obtain the same at the bookstore — and we did — but with some hesitation. The instructions went something like . . . texts A, B, and C are required; you may choose any one in the following groups: MNO, XYZ, etc. The department has no recommendation as to the superiority of one text over another . . . So we therefore compered the various choices by all the standard student's criteria: thickness, weight, pictures, cost, etc. And then a purveyor of wisdom, sophomore A, graciously offered his opinion . . . "Now Dr. Anatomy prefers M over N but N is the traditional choice. X is more readable than Y and actually the lecture material is taken from X; but Y is a newer edition with lots more pictures. And so on. We decided to select M and X. Whereupon sophomore B arrives on the scene and states an opposite view. After much haggling and heckling, the major decisions were made and we uncomfortably stated, "I'll take this one, this one, and this one. One hundred and how many dollars!!! You've got to be kidding! But she wasn't. And thus the point was driven home that not only was this to be a scholarly difficult journey, but financially also. Such financial need led us to the desk of Miss Kathryn Davis, alias the Secretary to the Dean, alias the power behind the throne. With a compassionate ear and a twinkle in her eye, she said leave it to me, and lo and behold, soon Mr. Parker was calling you in to place your John Henry on the dotted line.

During the first two evenings we were wined and dined by faculty hosts. The atmosphere was one of a strained congeniality, but each survived. We attended a picnic for our group, a guy named Bo, of whom we had heard much, our sophomore sages, and then without delay we were to await Monday morning.

1. Tuttle

2. Meads

3. Davis

Monday morning arrived and so did we — white coats, 18¼ pounds of books, wet palms and shaky knees. We were introduced to our own personal friend for the next four months and exchanged unusual tributes — vaseline for his head, hands and feet, and for us, the essence of formaldehyde to permeate our rainment, marking our station in training to all. We soon got to the bare facts however, quickly appreciating the efficiency and advisability of following dissecting directions line for line — not one artery more, nor one cutaneous nerve less. Dutifully but dubiously we committed to memory the foramen of Winslow, the triangles of Hesselbach and Scarpa, the canals of Hunter, Nuck, and Schlemm, the fascia of Calles, Scarpa, and Buck, and the ducts of Gartner, Stensen, Wirsung, and Santorini. The first practical wasn't too bad, but then we were working with our closest friend. But oh so strange how during the next quiz identical structures appeared so unfamiliar as someone else's best friend, wasn't it?

And the "Little Ole Lady" of Heiman et al. easily won the title of "Miss Challenge of 1965".

The Gestapo's really weren't so bad, were they? Or is there a functional mental block as to just what really did occur during those sessions.

During Christmas we felt secure enough to satire the course and those who attended Dr. Bo's drop in

will always have something on any art critic in judging Rembrandt's "The Anatomy Lesson".

Somehow we stumbled through and arrived at the final challenge — a game of solitary with a stacked deck. Why was it that your comrade in suffering had the questions you knew and vice versa?

But now, in retrospect, could we have had a more balanced team of mentors? Bo — the placable martinet . . . Thomas, the jovial philosopher . . . and McCreight, the compassionate confidant.

It was Dr.'s Odor and Kennedy who guided the ceremonies uniting student and microscope. Parotid, pancreas, or prostate . . . which was this supposed to be? And were they excretory or secretory? There was muscle that was smooth, reticulum that was rough; macrophages that were fixed, connective tissue that was loose; epiphyses that were closed, sinuses that open; arterioles that were efferent, lymphatics that

3. McCreight

4. Bo

5. Odor

6. Kennedy

Where's Dr. Thomas?

were afferent; follicles that were atretic, endometrium that was proliferative; and finally a body that was vitreous, a humor that was aqueous. And there were sessions in the darkroom where we were in the dark in more than one sense of the word.

During the lecture breaks there first appeared an early sloughing of shackles for which our class was soon to become renown. 'Twas a little thing, but interesting to observe. Early in the year, how dutifully we clustered in the hallway by Room 470, never venturing far afield. Within a month, or maybe two, the break was made, and henceforth upon dismissal of an hour, fifty-odd students invaded the snack shop for AM coffee. Small in significance, but nutritive for the spirit.

But the challenge of the semester was Neuroanatomy, i.e. Sulkin's Speedwriting I. Unless one had access to a Biggerstaff, there was much flurry following each lecture in order to complement each others notes. Once the tracts and centers were learned the results of various lesions were readily appreciated. The structural relationships of the internal capsule remained somewhat hazy, and a teaching model helped clarify the matter somewhat; for us at least, but the impression lingered that it didn't help Dr. Cale that much. (Hrup, hrup, hrup).

The semester drew to a close and with it went most of our doubts that we were going to survive this place called medical school.

Where is Dr. Maury?

7. Remy

From classes who had passed this way before we learned that the second semester could be a Venus fly trap. More afternoons were available for rest and relaxation and approximately 25% of would-be doctors became active duffers on the links. And all the while Strittmatter and Company ground

through the cycles, relentlessly presenting the TCA, pentose shunt, fatty acid synthesis, cholesterol synthesis, purines and pyrimidines, all interlaced with the justification that here was the functioning level of medicine.

Microbiology was our introduction to the finer things of medicine — big bugs and little bugs, round ones and long ones, red ones and blue ones.

Oh yes, that 5'9" Gram positive Homo sapien was never found anywhere in Bergey's Manual. It was only Bob Dillon, who discovered the veracity in the statement that a little crystal violet goes a long, long way.

The fungi were fearsome, the bacilli bewildering, and the viruses vexing. We desired the practical application of episomal transfer of facts and figures from our notes to our wearying cortices, but no respite was to come our way.

And it was during this period that we performed our first surgical procedure — the lawly venipuncture. The thought was worse than the thrust and there's probably still some lingering echoes of a Hale-ish cry "... get that thing away from me, Gordon! Don't you dore touch me!!!"

No — I'm Chepenik, Instructor in Anatomy

"Bacchanalian Suite"

or "Ode to Revelry" or

"Supine on My Spine Will I Dine from
the Vine"

Hark! The midnight oil is waning,
The holidays on us are gaining.
Strike the harp and join the chorus—
No more slides with which to bore us!
Raise your glasses up on high
To detail men now passing by.
Bringing gifts for girls and boys—
Stethoscopes and other toys.
Fight, fight, fight for Bowman Gray;
It'll look so good from miles away.
Tie your textbooks shut with holly,
Give yourselves to festive folly.
Ring out the old, ring in the new—
Resolve to earn a higher "U".
Resolve to study one hour per day—
Find your status become 1-A.

Neuro is come to test our timbre;
I need some fingers twice as limber.
I must tread the path of strife
Without a Biggerstaff of life.
So confused, my spinothalamic
As scholastic pains grow so dynamic.
Mene, mene, tekel, upharsin—
Ranson's book brings thoughts of
arson.

Gone is histo's obscure borrag
Of plasma cell and macrophage;
Mast cells looked like balls of fur;
That tonsil was just a oily blur.
The axon wrapped in cresyl blue
Upon my ire so quickly grew.
Yet, from our breasts sprang well of
hope . . .
Until the electron microscope.

Finally, though, we must be wary
Come the third of January;
By then St. Nick won't leave a trace
And Ph.D.'s will take his place.
Up to four they'll come with a bound,
Wondering if any brave soul's around.
But really, friends, we need not fear;
We can just say "no" to "Is that
clear?"

As jolly St. Nick drives quickly away,
He turns with his cheeks all aglow;
And as he turns 'round, he seemed to
say,
"All right, you, let's go!"

Phil Bickers

How would you advise a friend who was contemplating marrying a medical student?

Donna Rook Stroud, junior medical student:
Happiness is not complete until it is shared; being married to another medical student provides a special togetherness — sharing the same work, its joys and sorrows, its ideals and hopes, and even occasionally, the same extra precious time off together — to make it all seem more worthwhile.

Judy Broadhead, Virology research technician:
I would advise marriage in the Freshman year if at all possible because you can then "half-way" understand what's going on when your husband is called to autopsy, lab work, etc. and you're gradually "broken in" to the everyday routine. Patience and understanding are a "must".

Susan Kelly Blue, senior medical student:
I would not advise anyone to marry a medical student . . . unless she is one herself, but I wouldn't tell her not to marry one either. She should make her own choice. Frankly, if I weren't so busy myself, I would have to see more of my husband.

Vicki Resnick, former graduate student:
I think if they love each other they should go ahead no matter what . . . but be ready for a lot of lonely nights.

Why did you choose Bowman Gray School of Medicine?

Jim Chapman, freshman medical student: Because of the individual attention given the student. I was impressed with the general attitude of the people here and with the relationship between faculty and students . . . and I'm still pleased.

Ken Hauswald, sophomore medical student: I was particularly interested in attending Wake Forest College because it had its own medical school. While at Wake Forest, I learned more of Bowman Gray's reputation and wanted to come.

Lou Stein, junior medical student: I didn't really give much thought to coming here . . . but after my interviews I decided right then that if I were accepted here I would come.

Monty Woods, junior medical student: The Dean of my undergraduate school, Western Reserve, encouraged me to apply here, and I knew some former Western Reserve students who had come to Bowman Gray and spoke highly of it . . . The interviews here were the deciding factor.

THE SOPHOMORE YEAR

This was the year of the handout and the midnight oil. It was difficult to believe it had only been one short year ago that we began our journey. The coming year was faced with some apprehension, for we had heard and observed the effects of the Morehead monolith upon the body and psyche of all who were interred in Room 183.

This was the room of agonizing hours in the sedentary position. Strange how of all the class, only one revealed the common sense of utilizing a pillow. Perhaps therein dwells the reason for Kyle's springy gait today.

This was the room of agonizing decisions — the Lady or the Tiger, a la multiple choice exams.

This was the room of the autopsy clock — we awaited the toll of the chime that it was standard Y-shaped incision time.

This was the room of lantern slides — " . . . oh sleep, it is a gentle thing, beloved from row to row . . . "

This was the room of department rivalry and bull-headedness — " . . . this is not the way it's taught at the Heart Station, but it's the way we'll teach it to you . . . "

This was the room of the philosopher-pathologist — " . . . common things are common . . . "

This was the room of impatient sophomores — " . . . you'll not stop us now, we know our worth; let the circus begin . . . "

2. McCool

3. Striker

4. Rinker

And it did — all three rings simultaneously. The center ring was occupied by Human Pathology and featured Pritchard, Holleman, Foushee, Pool and Scharyj, with infrequent but delightful visits by Morehead and Ravens. We were spared the agony of the 10 minute pops of our predecessors but it only required the first quiz to convey the realization that what was required remained" . . . thus saith Morehead, page 53 column 2 line 51."

Interspersed between book time and lecture time were several visits to the autopsy room. It was here that we were slapped full in the face by the coarse reality of the battle we had entered upon; here the results of an encounter between physician and disease lay open for all to bear witness, and hopefully, the critique of this particular skirmish would prove helpful tomorrow.

1. Dr. Dudley sections a heart

How important is anatomy to your training as a physician?

Ed Karotkin, sophomore medical student: I guess its great importance lies in the initial introduction to medicine it provides. After the first fright, I found the daily quizzing a challenge.

Hersey Miller, junior medical student: It's very important. Even now I'm using my knowledge of anatomy on Orthopedics. Anatomy helps to clarify the total disease picture. The daily oral testing (in addition to scheduled orals) prepared me well for the oral demands coming in these clinical years.

Dan Broadhead, senior medical student: "Anatomy and I were less than friends — in fact we scarcely got acquainted — so I have found myself trying harder to make up a mythical deficit. Anatomy taught as it is here is inferior to what it could be — it should be taught by practicing physicians such as surgeons, neurologists and the artists of physical diagnosis."

Pharmacology was a challenging course, requiring a grasp of the generalities of a group of drugs and then further to master the idiosyncrasies of each individual group member. Remember the graph of epinephrine, norepinephrine, and isoproterenol? From the commonness of acetylsalicylic acid to the enigma of norimpramine, we were offered the details of drugs, their actions and reactions — knowledge which was essential if we were to "... primum non nocere."

Did you get your handout? If not, everyone knew you had cut Physiology. Most were up to date but there were a notable few dated 1958, or was it 1858? The course was divided into "Normal" and "Abnormal", but it was usually difficult to divide the difference between the two. The labs were practical and enjoyable, if the dog cooperated; most became quite expert at cannulating a carotid, but then there were discouraging times when you might have cast a casual glance at the wound site only to see the field disappear under a gush of crimson fluid.

An additional gain from both Pharmacology and Physiology was the experience of the multiple choice quizzes; all will agree that these indeed were valuable warm-ups for the spectre of National Boards which lay ahead.

The pre-clinical classes were anxiously awaited and following finals, we gratefully and exhaustedly embarked upon our initiation into clinical medicine. In Physical Diagnosis we looked and listened and palpated and percussed (would you ever learn to

hit that sore finger just right?). Up on the ward we took a Hx and PE in a record time of 5 hours and that sometimes did not include the write-up. Surgery was a wonderful time of "johnny bobs", lampblack, surgeon's knots and bowel anastomoses.

And then it was over. Most of us made a trip to Raleigh for State Boards which, because of our faculty's foresight, was generally a benign formality. National Boards, Part I, was a different matter however. Truly a traumatic experience; dark thoughts haunted us throughout that summer interlude.

And so the first two years came to a close. Was it really over, and were we ready for the wards?

This is all very fine, but it won't do — Anatomy-Botany — Nonsense! Sir, I know an old woman in Covent Garden who understands botany better, and as for anatomy, my butcher can dissect a joint full and well; no, young man, all that is stuff; you must go to the bedside, it is there alone you can learn disease. — Thomas Sydenham

Activities were varied and sundry — learning from a jiggling line recorded from a mournful hound; bearing the discomforts of perpetual discussions, full of sound and fury, signifying??; the arm-twisting tactics of political peers; a few seeking respite in oral gratification and others happily discovering where and by whom the little pink and grey capsules are made . . .

Circle the correct letter by inspiration from afar,
How does this differ from pressing o bar?

Should the student be involved in community medical projects, e.g. sex-education?

Laura Winstead, freshman medical student: This is a good thing. The students may be in a better communication position than would physicians without projecting the "big father" image. It's a good way to gain early experience in dealing with groups and in learning to project ourselves to people.

Robert Austin, junior medical student: "Community projects offer the medical students important opportunities both in human-interaction and, as in the sex-education program, preventive medicine. Further, it is to the degree that each of us succeeds in both of these areas that our final success as physicians must be measured."

Chuck Bean, junior medical student: Yes, but on the students' own initiative — not as a function of Bowman Gray. It helps the student to communicate with the community and to improve his understanding of medicine. I hope we can soon push our association with Forsyth Memorial and Kote Biting Reynolds hospitals.

Sam Dizzia, junior medical student: The physician, as a well-respected member of the community should certainly be involved in all community projects possible. Even first and second year students, being supposedly more mature persons, could contribute through social improvement and aid to the depressed.

The last two months of our sophomore year were a jumbled and confusing attempt to bring all our pre-clinical knowledge into a clinical focus so that we were not to be perennial graduate students but rather perennial physician-students. To help us through the early stages of metamorphosis were Dr. Felts and his cohorts in Physical Diagnosis who shuttled us from classroom to lab to ward and urged us to thump and auscultate our classmates and spouses. Many a wife, her eyes burning from eager but prolonged ophthalmoscopy has them to thank.

And as we learned to look at living beings and their physical attributes, we were being urged to remember also the psyche. Dr. Gulley began the mission our Freshman year; Dr. Cutri continued the process the next year and we looked forward to, but were unaware of, the import of Junior year amphitheater sessions with Dr. Randolph or the Senior clinics under Dr. Pearson where we were to come to grips with the problem and realize that regardless of classification systems or theoretical bias each ego is unique and deserving of individual attention. We could not as sophomores have realized how much we were to learn about ourselves from these men and their house staff.

Those last days — those were the days — when some of the basics of surgical theory and technic were put before us. Our hesitantly placed sutures pulled loose, our wounds got infected and our rabbits passed on. We learned to scrub in a most dramatic way — and how to tie knots, splint legs, and start IVs. What seemed so complicated then has become a part of our everyday life. Surgery was presented in such a way as to interest even the non-surgeons among us. And who can forget the coffee at the examination?

To keep us mindful of our insignificance in the long span of medical history, Dr. Pritchard and his volunteers delighted us with tales and slides.

Our development as physicians has been stretched through four long years — in that time we as persons have changed — we have grown. The annual staff feels that the contributions made by the Behavioral Sciences Center Staff have gone unrecognized. They have struggled to give us a sense of perspective so that we could see ourselves as a functioning part of society and not an isolated segment. We are grateful that they have not given up. We want to make special mention of Drs. Mace and Vincent for their willingness to help us understand ourselves.

Do you feel that the pre-clinical years prepared you well for the two clinical years?

Allen Bevis, senior medical student: Yes, in most respects. Pathology and Pharmacology prepared me well, though I found the Pathology course here was very sketchy compared with Miami's. The teaching here is much better than at Miami: more teachers; student warmth; however, teaching is a problem everywhere — for instance, the most knowledgeable instructors are often poor lecturers, etc.

John Gregg, senior medical student: "Ah, yes — I remember the day well, when 52 Graduate Students entered the hospital searching for the Embden-Meyerhof Pathway!"

Betsy Parsley, senior medical student: Yes, I would say so, though I feel we should have been supplied more clinical facts, more practical information; there is a big transition to make in learning to use technical material. I would have given a flat "no" to this question last year, but now I see more correlation . . .

Julian Taylor, senior medical student: Not as much as they could have had we had more exposure to clinical problems.

THE JUNIOR YEAR

For two years we had awaited the feel of warm flesh and the first contacts with our patients sent a surge of ambivalent emotion through our beings. From physical inspection and laboratory analysis we could formulate that here was a pathologic specimen. But then if one only put aside the sterile labels of a diagnosis and went to the patient . . . for him to talk . . . and you to listen . . . there came a slow emergence of the true state of affairs. No, this wasn't a process which happened to be accompanied by a person . . . this was first of all a person, who by perchance (?) was afflicted with disease. But the two sides of this coin often oscillated in degree of importance as we involved ourselves in the tasks at hand.

During Surgery we concentrated on holding that retractor just where it was needed, the position so amiably called out by the resident when our field of perspective was occasionally restricted by a vast expanse of green, an elbow in the ribs, and aching vertebrae. We were quizzed on such and such a structure which was somewhere in that hale at the end of our arm, and more often than not serendipity provided a more astute reply than any anatomical landmarks could provide. But following the procedure we came into our own. We could easily be the first to pick up the moist rales in the basal lobes, or feel the warmth of an impending infected incision site . . . we watched that patient as if we ourselves had been the surgeon instead of retractor holder, fourth removed. And of such diligence we oft were rewarded by an occasional patient's query . . . "Hey, Doc, who are those other guys who come around once or twice a day? . . ." And then the next procedure didn't seem so long and you became a member of the team.

The weeks of Medicine were filled with five page workups, CBC's with platelets every day (with 4+

empathy for those unfortunates with hematology patients numbering 2 or more), Heaphy tubes, and Levins. And rarely did a night go by when a sweet voice on a telephone said . . . "Dr.———, your IV has just infiltrated,—about an hour ago." Slowly confidence in our histories grew and we began to concur that a Grade 2 murmur really was there and wasn't built into the resident's stethoscope. Here on 3d West we came to realize that disease was a complex often infathomable state and true to an earlier saying, each patient represented a personal being, unique unto himself, regardless of similarity of disease.

Obstetrics was a period of watchful waiting, with appropriate entries of interval, duration, and intensity to be made at reasonable times. In performing these delicate chores we hopefully became adept at being anticipators of precipitators . . . usually. Dutifully we clamped and cut the cord and were allowed to deliver (or gracefully catch as the case might be) the accompanying villous organ. The nights were long and sleep was scant, but after the aggravation at the irregular happenings had past, we humbly acknowledged that this indeed was a sacred event and that we had shared in a sacred trust.

And there was a time to learn of the little people and their unique ways. A paternal pipe puffing professor exhorted us to tread softly amongst the physiology of his pediatric patient, and more frequently than not, a not so subtle "blah" was sufficient response to a iii cc's thoughtless reply. A special note must be made of the pediatric house officers. They took to heart the Hippocratic charge "to impart precept, oral instruction and all other learning" and we perceived that in some manner which cannot be easily identified, they exhibited both a drive and attitude toward student teaching not commonly found in other H.O.'s.

Do you feel your Junior-year lab work was profitable? Why?

Bob Buchanan, senior medical student: Profitable and non-profitable. We learned (1) how to draw blood, and (2) how to do simple procedures. It wasn't worth a whole year's time; this makes you hostile to the entire organization. More supervision was needed, and more practice in other useful office tests, such as culture techniques.

Dove Meyer, senior medical student: "To the degree that reasonable familiarity and proficiency were developed in simple lab procedures I feel the lab work was worthwhile; **but the remaining eight months were superfluous.**"

Buck Pridgen, senior medical student: Yes. Interpretation of smears and learning how to look at urine were important, but doing hemoglobins and hematocrits were a waste of time.

Richard Taylor, senior medical student: I thought it was not profitable. We seldom saw anything abnormal, and when we did, we weren't sure how to interpret it. It also took away from time I could have spent observing more closely the course of clinical disease in my patients.

THE SENIOR YEAR

Our senior year was upon us; that which had seemed so far away was nearer at hand. To our shallow expertise of Hx and P. E. we now began to add the modes of treatment of what we diagnosed. This year we came into more frequent contact with the faculty and staff man. From him we could appreciate the fusion of knowledge and experience, if indeed the two are separable.

And we rotated through the OPD, where we became the physician of first contact; the ega-swelling feeling of finally having a patient of your very own was quickly tempered by a gentle reminder that you, a fourth year student, represented the medical center to this one patient.

In the EOR we saw and practiced medicine of the moment. There were those who needed acute care, continuing care, and those who wanted only a sympathetic ear and a few minutes of your time.

But how about National Boards? It seemed kind of unfair to require a class of whom 75% passed Part III to take Part II, didn't it? But we suffered through this ordeal as we had for Part I — and again

survived.

Applying, interviewing, and awaiting March 10 was likewise a trying time. "I like you; do you like me?" — so the charade went at each prospective site. The formal machine slip notified us to whom we belonged and then we knew we were truly in the home stretch.

* * * * *

Graduation is yet another marker of the journey in our chosen profession. More properly it represents the beginning of a physician's trust, rather than the culmination of four years study. The faculty's diploma acknowledges only that we have the requisite tools to practice our profession, not that we are proficient — proficiency must be acquired through application. As each one goes his own individual way, let no one violate this chosen trust — students we will always be, if we are to be the good physician.

Respectfully submitted,
Durward Pridgen

ADVICE TO STUDENT

Which pre-clinical courses do you feel are most helpful in the clinical years? Which the least helpful?

Phil Bickers, junior medical student: I feel anatomy is most important, because if one can mentally picture the regional anatomy of a pain, he can better arrive at the differential diagnosis. Biochemistry thus far seems least pertinent because of its lack of correlation to clinical diseases.

Bob Jacobsen, senior medical student: I think Physiology is most useful, and possibly Biochemistry also. Pharmacology could be more helpful if integrated more into the clinical setting, particularly during the last two years. The amount of time allotted to each course is pretty much proportional to its value, I find.

Marty Resnick, senior medical student: Physiology has contributed most to my understanding of the pathogenesis of various diseases.

Hayle Setzer, senior medical student: Anatomy is basic to everything else . . . Much time was wasted on Enzyme Kinetics in Biochemistry. Pharmacology was a good course, but it could be more beneficial after some clinical experience.

Which rotation did you find most interesting? Why?

Irving Elkins, senior medical student: Surgery, chiefly because that's where my interest lies. Also because I can be doing things actively rather than having to wait around getting frustrated (and being passive).

Ron Krouser, senior medical student: That's basically what I'm interested in and there was a lot of Cardiology, which really appealed to me.

Ron Ray, senior medical student: Pediatrics. It was more consistently good — the house officers are often better teachers than the staff.

Sam Scott, senior medical student: Medicine, simply for the variety of patients.

With the help of consultants on the words, and in spite of thick undecipherable charts in the OPD, we managed to learn.

In our Senior year we met
Dr. Quivers who helped us listen
to little hearts.

Why is it worth the effort to do an elective outside Bowman Gray?

Jim Hannah, Neurology — London "The more obvious advantages include exposure to medical practice in another hospital, taking advantage of a different group of men and thinking through their problems. My experience in London offered an opportunity to study in depth a particular facet of medicine which was of interest to me. Also available was the exposure to a different type of medical organization toward patient care. Finally the opportunity to live in London was in itself worthwhile."

Jim McAlister, Obstetrics — London "The fact that the student puts more into his elective; the exposure to different concepts; and the opportunity to travel, all make an outside elective worthwhile."

Tom Heffner, Hospital Ship Hope — Ceylon "The benefits are obvious: seeing medicine practiced under different conditions; learning other physicians attitudes; having the chance to travel, and probably most important in the long run — living in another culture and learning how other people besides Americans view life, death, and taxes."

Dom Addario, Neurology — London "Medical education is not unlike any other educational process. Accumulation of facts without a sense of history is unoriented knowledge. To obtain a greater sense of medical history was a principal reason for travel during my elective."

SENIOR CLASS OFFICERS

Dom Addario, Vice-President, Tom Heffner, President and Kyle Young, Secretary-Treasurer

In the three years of contact with the Class of 1969 **Timothy C. Pennell** has left a significant impression. Ours is not a class that is easily impressed by age, honors, or rank in teaching hierarchy. **We** judge a teacher on his interest, effort and sincerity. By our criteria, we find Tim Pennell worthy of this — the highest honor WE can give — because he is a true physician, teacher, and friend.

EPILOGUE

This annual is like a love child engendered guiltily in stolen hours from academics — disadvantaged, struggling, developing with much less attention than he deserves. What began as a beautiful dream is tarnished by the realities of life; what began as our first born loved one has become our motherless son. We wanted to love him but now curse him for the despair, frustration and heartache he has brought. We can no longer suffer to bear him and thus we turn him over to you . . .

At last
the Ultimate:
A Registered Nurse.

Reader, this is our ad section. This annual could not have existed without the financial support of these firms who have been so kind as to buy advertising space.

This annual costs roughly \$6000 to produce and the school only contributes \$1200 to this. The remainder of the cost, under the present system, must be found by diligent searching on the part of our business managers for firms willing to support us.

For this reason we urge you to do business with our advertisers in preference to others — as these people have come through to help us when we needed them.

"Take it from me, boys, nursing school is not all work!"

"Yeah, we're nurses. Whot about it?"

"Sock it to me, sock it to me, sock it to me!"

"How long have you had these feelings of superiority?"

"She took my bippy."

THE PHOENIX MUTUAL LIFE INSURANCE COMPANY

HAS EARNED THE

NATIONAL QUALITY AWARD FOR 1967

One of the highest honors which the life insurance fraternity can bestow, the National Quality Award attests to an underwriter's outstanding service to policyholders in maintaining and extending the benefits of life insurance.

VICE PRESIDENT AND MANAGER OF AGENCIES

Qualified for the Second year

After these four years, wouldn't you really rather be a VETERINARIAN?

"Hey lady, can we come to your school and teach the kids about SEX?"

BIG AL HERE!

The Evolution of a Physician

Dean Meads we did hear
 In September, our first year
 Tense and worried and nervous, too,
 We wondered if we would pull through
 First, there were Bo and McCreight,
 Who taught anatomy just right
 Do know this and know that
 We pondered where we were at
 Suddenly, January was here.
 Our first exams did appear
 Oh! Oh! Did I survive?
 It's great to be alive!
 Some confidence we did have
 In good ole bio-chem lab
 In microbiology we did find,
 Antibodies were the cure every time
 Phase I was over our evolution
 We then made one resolution:
 To swim, golf or whatever fun
 Until our second year had begun
 September had come once again,
 And the three P's hit us with a grin
 In physiology and pharmacology we did receive —
 Many handouts, would you believe?
 Many autopsies we did partake,
 Thus, reports we did make
 In pathology we did learn
 Those multiple choice questions were of great concern
 In surgery we did see
 How everyone was busy as a bee.
 Now that we have given our first shot,
 We feel that we can do a lot.
 Exams are drawing nigh,
 So wives heave a sigh
 Feed him at the appointed hour,
 Or else his mood will sour
 Dedication and fortitude medicine does demand,
 In him and in her — go hand in hand
 Perry Vandyke (Sophomore wife)

We've put regional service on a new plane.

Piedmont Airlines jets to cities like New York, Atlanta and Asheville from nearby Smith Reynolds Airport.

The jets are new 737s, with more big cabin comfort than any other short-distance jetliner.

From Winston-Salem, you can enjoy Piedmont service to over 50 cities in the care of expertly trained professionals. They know service isn't measured in miles. That's why they go a long way to please you.

See your travel agent or call 767-5222 for reservations.

EDITOR'S NOTE

On this, the eve of our final deadline, I find myself a little sad, because this annual is not what we had hoped. We started with several tremendous ideas about how our annual should be—but faced with realities we have had to drop them. Some have been retained and I would like to proudly point them out. This is one of the few annuals published jointly with another school; the education and philosophy of the schools are different so we chose to dramatize this with the double covers. We felt that we had more than one faculty member to honor because of their contributions to our education so we instituted "The Gray Matter Cites"; to point out six others besides Tim Pennell who are worthy of special note. The organization of this book is not around a "theme" other than the development of our class into physicians—this book is really just for memory's sake. Another new thing is the opinion pages where we have tried to gather some thoughts about this medical school from its students.

Today's medical student reflects the trend of the nation's students to be involved in this society and not to be isolated into medicine alone. John Kloss and John Gregg have pioneered involvement in our local schools. Others have gone overseas. We would have loved to print short essays about the draft, financing medical school, and efforts of students to help guide their own education but few were willing to contribute and I did not feel that I could accurately represent this class.

What of the future of the annual at this institution? I, for one, do not advocate a continuation of the present situation. We, the annual staff have invested many hectic hours in this "the last of the thankless jobs". There are hours which should have been spent studying—but once we accepted this task we had to see it through. I wish to thank Ray and Hoyle for their dedicated efforts. I propose that following yearbooks be short, with all photos of students and faculty members submitted free of charge to the annual staff, and with exclusion of the various paramedical personnel and graduate students unless their groups submit their pictures so that the editor can edit rather than write the annual and so that medical students will not have to take countless (go ahead, try to count every picture in this book that we had to take!) pictures. As mentioned in the ad section the medical school pays one-fifth the cost of the annual and expects the medical students to scrounge up the remainder by selling ads and make enough profit (\$800) to pay the quarter's tuition for the editor and one business manager. Such a philosophy is not in the best interests of the students who attend this fine school. I mention this in hopes that should the annual continue at this institution, future editors will have better, clearly defined, conditions in which they can create a book for their class. The annual is worthy of being continued here.

I'm a photographer and would-be poet who has enjoyed the photographic and creative aspects of this ordeal but wouldn't do it again for anything. I think we can be proud that we have created something unique.

PEACE!

Don Broadhead
14 March 1969

To Robert W. Prichard, our own special Flying Fickle Finger of Fate award because he represented to us those reactionary forces who persisted in involving many hours of our limited time in what we considered basically uneducational laboratory procedures. This award is given in hopes that he will amend his ways!

Stay tuned for our next week's show when the award will go to the Student Publications Committee for requiring "educational" senior papers.

Who says medical students can't have fun?

Represented Nationally By SAWYER-FERGUSON-WALKER CO.

A NEW MEDICAL FACILITY FOR WINSTON-SALEM . . .

MEDICENTER/Winston-Salem

W. First St.

A MEDICENTER IS AN EXTENDED CARE FACILITY FOR PATIENTS WHO DO NOT NEED TREATMENT IN AN ACUTE GENERAL HOSPITAL, BUT ARE NOT WELL ENOUGH TO GO HOME.

PURPOSE OF THE MEDICENTER IS TWO-FOLD:

- IT RELEASES HOSPITAL BEDS FOR PATIENTS WHO NEED HOSPITAL CARE.
- IT REDUCES HEALTH CARE COSTS TO THE PUBLIC. CARE IN A MEDICENTER IS ABOUT ONE-HALF OF THE HOSPITAL COST.

THIS NEW MEDICENTER, SCHEDULED TO OPEN IN THE SPRING OF 1969, WILL HAVE 231 BEDS. IT WILL HAVE ATTRACTIVE ROOMS, TELEVISION IN ROOMS, ELECTRONIC NURSE CALL SYSTEM, BARBER AND BEAUTY SHOP, NURSES ON DUTY AROUND THE CLOCK, PHYSICAL THERAPY ROOM, CHAPEL, HOBBY ROOM AND OTHER FEATURES.

IT WILL BE A NICE PLACE TO GET WELL.

MEDICENTER/Winston-Salem

FAMILY MEDICINE PROGRAM

Approved three-year program (including internship) in FAMILY MEDICINE, closely affiliated with University of North Carolina School of Medicine.

Our program offers:

1. Broad experience in internal medicine, pediatrics, and community medicine.
2. Maximum continuity in relationships with selected families, whom the resident serves as family physician.
3. Sufficient electives to permit individual program planning.
4. Competitive salaries and benefits.
5. Emphasis on education.

Also available are approved residencies in internal medicine, pediatrics, and pathology.

Looks like a blank to me.

Stick around.

One of the best things about growing up in this area is that you never have to leave it. Because its economy is growing by leaps and bounds, producing new job opportunities in both business and agriculture. Too, you'll find technical and higher education facilities second to none. So, come graduation time, stick around. You won't find a better place to live, work and play.

Duke Power
